Key recommendations:

- The CBD should adopt a precautionary approach to its work on innovative finance mechanisms, based on detailed evidence of their potential to contribute to the effective implementation of the Convention.

- Existing and innovative finance mechanisms for conservation must adhere to stringent safeguards consistent with CBD standards and the international obligations of countries to uphold the rights of indigenous peoples and local communities.

- Proposed GEF safeguard principles on indigenous peoples must ensure close alignment with relevant CBD norms as well as minimum standards enshrined in the United Nations Declaration on the Rights of Indigenous Peoples.

- International processes to design a system of information on REDD+ safeguards under the UNFCCC should include, inter alia, information on compliance with CBD standards and work programmes, including elements relating to indigenous peoples and local communities.
This submission to the CBD Secretariat is presented by the Forest Peoples Programme (FPP) in response to the Secretariat’s call for information on the potential role of innovative financial mechanisms in the achievement of the Convention’s three objectives linked to biodiversity conservation, sustainable use and equitable benefit sharing (pursuant to decision X/3, A, paragraph 8c).\textsuperscript{1}

The information provided includes brief assessments of three different finance mechanisms: Payment for Ecosystem Services, Biodiversity Offsets and REDD+. Each mechanism is assessed in relation to its:

(i) possible impacts on the rights and livelihoods of indigenous peoples and local communities
(ii) potential consistency with associated CBD objectives, standards and work programmes.

The final part of the submission presents some general conclusions and recommendations for consideration by the CBD Secretariat and Parties to the CBD. FPP welcomes this opportunity to comment on innovative finance mechanisms and their relation to the effective implementation of the Convention.

1. Payments for Ecosystem Services (PES)

Payments for Environmental or Ecosystem Service (PES) normally involve payments to land owners and managers conditional upon their provision or restoration of one or more ecosystem services (water, watershed protection, soil conservation, carbon storage, biodiversity etc). Parties to PES agreements may make exchanges at the local, national or international levels. Payments may be made through a range of finance mechanisms including user finance (payments by beneficiaries), public finance (government-run schemes and environmental subsidies), market finance (mostly confined to carbon offset trading) and payments of ecological debt from Northern cities and industries to traditional landowners and managers in developing countries.\textsuperscript{2}

Most existing PES schemes in Latin America, Asia and Africa are publicly funded through State funds and through international agency grants and loans from multilateral development Banks.\textsuperscript{3} Other than carbon trading projects for afforestation, no globally agreed market-mechanisms exist for payments for biological, watershed and climate services, though some NGOs and groups advocate this approach through the establishment of new markets for “eco-utilities”.\textsuperscript{4} As with carbon trading (see below), such market-based PES proposals are very controversial and face numerous technical, economic, ethical and methodological problems (e.g. objective and verifiable quantification of services).

Several large PES schemes affecting forests and other ecosystems within the territories of indigenous peoples remain at the research and preparation stage i.e. with no defined finance mechanisms yet in place.\textsuperscript{5}

Risks and challenges:
Although detailed studies of PES impacts remain limited, emerging lessons show that the sustainability of such schemes can be undermined due to a lack of meaningful consultation with
affected and participating indigenous peoples and local communities, a failure to respect the rights to free, prior and informed consent (FPIC) and lack of recognition of customary land and resource rights.\textsuperscript{6}

Other risks and potential impacts associated with PES finance and projects include local inflation of land prices in areas covered by the scheme that may lead to land grabbing and a reluctance by governments to resolve indigenous land claims (rent-seeking behaviour by government and the private sector).\textsuperscript{7}

A further possible problem with PES schemes is that the transacting parties might not necessarily be the legitimate owners of the land or may exclude those people and communities whose historical and present behaviour maintains or affects an ecosystem. Thus, there is a significant risk of top-down actions obliging local people and others to change their behaviour while allowing the PES contracting parties to reap most or all of the benefits.

PES schemes often seek to change local livelihood practices, and ill-conceived initiatives risk imposing unjust and unscientific restrictions on the livelihoods and customary resource use of indigenous peoples and local communities.

Poorly designed PES finance for national or local conservation schemes may thus have direct negative implications for the fulfilment of country commitments under CBD Articles 10c and 8j under which Parties have duties to respect and protect the customary use and traditional practices of indigenous peoples and local communities.

Like most environmental payment schemes, PES risks generating perverse incentives for unscrupulous land managers who may threaten to damage resources and destroy services if payments are not forthcoming or if payments do not meet a certain level.

Emerging lessons from PES initiatives indicate, inter alia, that:

- good legal and governance frameworks and systems for local benefit sharing are needed in order for PES schemes to be sustainable and equitable\textsuperscript{8}
- secure land and resource property rights are an essential precondition for the generation of local benefits\textsuperscript{9}
- where transaction costs for participation in PES programmes are high, indigenous peoples, local communities and small holders may be excluded or receive only modest benefits\textsuperscript{10}
- the costs of PES engagement must be carefully scrutinised in order to assess potential net benefits for communities/households
- communally-owned land can be more suited to effective enforcement of PES rules and sanctions and may also help reduce transaction costs\textsuperscript{11}
- Without robust procedures for targeting PES schemes, monitoring and oversight, payments may not help protect biodiversity and local livelihoods
- There is a need for more detailed empirical studies of PES schemes to assess their impacts on local livelihoods and the environment
- making PES schemes financially self-sustaining over the long term remains a major challenge.
Potential opportunities:
There is some evidence that well-designed PES policies and projects formulated with the full participation of customary landowners and communities can deliver biodiversity and local livelihood co-benefits.12

Some indigenous communities have reportedly benefitted from forest protection payments under public-funded PES schemes in Mexico, where different communities have chosen to use funds in different ways in support of conservation and community development.13 In other cases, the livelihood and rights impacts of PES schemes appear to be mixed, with some communities enjoying worthwhile benefits and others receiving only modest rewards. Positive outcomes are linked to strong land and resource rights and PES recognition and support for traditional land management practices and customary law.14

Well-designed PES programmes affecting the lands and territories of indigenous peoples that are built on early prior actions and measures to respect customary rights and uphold free, prior and informed consent thus have potential to help meet the objectives of the Convention. Such schemes could assist Parties to further the implementation of specific CBD standards such as Article 10c through support for customary systems of ecosystem management and community conserved territories.

2. Biodiversity offsets

Proposals for finance for conservation through biodiversity offsets are gaining momentum among governments, large corporations and conservation NGOs. This type of finance mechanism is based on the provision of funds to protect a specific site or habitat in one place as compensation for the destruction or damage to biological diversity caused by a development or commercial activity at another site.

Risks and challenges:
Like carbon offsets (see below), this finance tool is controversial and plagued by complex scientific, legal, ethical and economic problems. Demonstrating that two biological sites are ‘equivalent’, for example, is fraught with difficulties and vulnerable to abuse and ‘green washing’. Clearly, biological diversity in two locations will differ in some ways, and each biological site is to a certain degree unique (i.e. how can one forest be identical to another?). It may be argued therefore that offsets can never truly compensate for the destruction of nature and the end result may well be a net loss of biological diversity.

Studies of existing schemes reveal that the risk of net losses of biodiversity can be exacerbated where the biological “quality” of the offsets is very low (e.g. wetlands exchanged for dead pools of water).15 Offsetting also risks distracting project developers away from measures to avoid or minimise environmental and social damage at the resource extraction/development site.
Although most initiatives promoting biodiversity offsets suggest that a “mitigation hierarchy” needs to take place (requiring that avoidance and minimisation of environmental destruction is ensured before offsetting is considered),\textsuperscript{16} evidence shows that this mitigation hierarchy is not always respected in practice. Studies in Canada and the USA, for example, indicate that rather than avoiding or reducing damage, projects typically skip straight to offsetting.\textsuperscript{17}

A further potential problem with offsets is that they could be used to either strengthen existing or create new protected areas at other sites that may apply exclusionary conservation approaches at the expense of local people (in disregard of CBD and other standards requiring inclusive and rights-based approaches to protected area establishment and management).

FPP is thus especially concerned that biodiversity offsets may pose serious risks of social harm and rights violations unless rigorous safeguards and due diligence are guaranteed. Such risks are effectively doubled when compared to non-offset initiatives. This is because tenure and livelihood rights must be fully recognised and respected at both the site of potential habitat loss or damage and at the proposed offset site. This necessarily requires that extra resources are required for effective due diligence at two sites, which in turn has implications for transaction costs.

The wealth of evidence from resettlement and relocation schemes confirms that seeking to ‘compensate’ and replace livelihoods lost to development actions is complicated in practice. Effective compensation and mitigation requires long lead times for very detailed baseline studies, meaningful participatory planning and robust mechanisms to respect the right to free, prior and informed consent.\textsuperscript{18}

While emerging voluntary standards for biodiversity offsets mention social and rights issues like FPIC,\textsuperscript{19} there are genuine risks that policy implementation may be superficial or rushed unless adequate time and resources are dedicated to ensuring compliance (see literature on problems with implementation of voluntary standards in the logging and palm oil sectors).\textsuperscript{20}

Given the high risks, potential high transaction costs and the multiple methodological problems associated with biodiversity offsets, this finance mechanism does not appear to be well aligned with the objectives of the Convention.

3. REDD+ and avoided deforestation finance

A global framework for financing REDD+ actions remains under negotiation within the UN climate convention. Meanwhile, existing government and NGO proposals for REDD+ finance mechanisms include international and national forest funds supported through public funding. Other proposals for REDD+ finance mechanisms include payment for environmental service schemes and various market-based mechanisms (including carbon offset markets, rainforest bonds, etc), or some combination of public and market-based funding sources.\textsuperscript{21}

Pilot REDD+ funds under the World Bank and UN provide grants for national readiness planning and actions to facilitate possible future market-based finance for national and sub-national REDD+
programmes. At the same time, local voluntary REDD+ projects based on carbon offset trading are proliferating on the ground, often with little or no regulation (see below).

**Risks and challenges:**

Without rigorous adherence to agreed social and environmental standards, both public and private funding for REDD+ pose multiple risks for both forest peoples and forest biological diversity.\(^{22}\) Key risks associated with flawed REDD policies and finance include land grabbing, corruption, elite capture, violation of indigenous peoples' rights (including rights to their customary lands and traditional livelihoods) and destruction of natural forests by afforestation and tree plantation schemes.\(^{23}\)

Inappropriate use of REDD+ finance in support of flawed legal frameworks in the forest and conservation sectors risks reinforcing outdated and unjust colonial forest, land and conservation laws and a return to a 'guns and guards' conservation strategy aimed at protecting 'forest carbon stocks'. REDD+ funding for defective national REDD policies and strategies could likewise lead to renewed and strengthened central government control over forests.

Such outcomes would potentially violate CBD standards and undermine advances made in rights-based conservation, participation and local governance established under the Convention's Programmes of Work on Protected Areas (Element 2.0) and Forest Biological Diversity.

There is a significant risk that indigenous peoples and local communities may be pressured by governments, NGOs and the private sector to 'opt in' to inequitable carbon contracts that threaten to lock them in to unjust financial and land use arrangements for many years. Without proper screening and independent verification and legal support for communities, there is a danger that such arrangements could violate CBD standards (such as articles 10c and 8j) as well as the human rights obligations of REDD countries.

There is evidence relating to voluntary REDD carbon trading projects that shows that these potentially adverse impacts of sub-national REDD+ policies and investments are already taking place in some tropical countries (e.g. Colombia, Peru, PNG).\(^{24}\) FPP field studies indicate that there is a failure to screen REDD carbon standards and project auditing against international obligations. Current sustainability and compliance assessments tend instead to be based on project adherence to outdated national legal frameworks. At the same time, there is much evidence to show that consultation with forest communities by NGOs and government agencies promoting REDD has so far been superficial and that robust procedures for upholding the right to free, prior and informed consent have not been followed (e.g. in Cameroon, Guyana and Indonesia).\(^{25}\)

As well as the general risks noted above, there are major challenges linked to market finance mechanisms as well as the basic economic assumptions underlying REDD+ policies. Recent studies indicate that use of an opportunity cost model for REDD+ finance, for example, is inappropriate for addressing governance, equity and tenure issues. Other studies show that the use of 'least cost abatement curves' in the design of national REDD finance and activities may impose unfair costs on indigenous and local communities that could threaten their food and livelihood security.\(^{26}\)
Serious problems also exist with plans to finance REDD through carbon offset markets. Climate justice critics maintain that carbon offsets are a false solution to climate change, while economic studies demonstrate that carbon trading transaction costs are likely to be high and the potential to deliver significant local benefits is limited, with most potential benefits accruing to traders and commercial interests. The vulnerability of carbon trading to large-scale fraud and corruption as well as price instability in international markets is also seen as a major weakness of carbon market finance mechanisms. Given all these difficulties, some REDD policy-makers are starting to recognise that a global forest carbon market is unlikely to develop in the near future and that alternative funding approaches need to be examined.

Alternatives to carbon finance include proposals to issue ‘rainforest’ or ‘green’ bonds on international markets to provide up-front capital for forest businesses involved in forest conservation and development. Proponents of this mechanism maintain that these bonds would minimise risk and potentially attract large investors such as pension funds, as well as fostering public-private partnerships for forest development.

One risk with this approach is that such bonds could be used to provide credit to large-scale industrial logging and plantation companies whose operations are a proven threat to forest biological diversity and local livelihoods. In many countries, logging and timber concessions remain contested and are often superimposed on the customary lands of indigenous peoples and forest dependent communities.

Without proper regulation and control and full respect for land and territorial rights, bond-based finance mechanisms skewed towards large investors and private sector interests might create land and resource conflicts and land grabbing in developing countries. As currently conceived, it is not apparent how forest bonds (or even ‘community forest bonds’ as proposed in developed countries) might be used to provide benefits and support for conservation and sustainable use activities of indigenous peoples and local communities with limited capital and income. Indeed, such approaches might risk indebtedness of communities and generate economic pressure on them to enter into inequitable partnerships with large companies to repay bond debts.

**Opportunities:**

Scientific evidence shows that effective conservation and sustainable use of forest ecosystems is more likely to be achieved by indigenous peoples and forest-dependent communities than through governmental and commercial interests. CBD objectives could be advanced through the use of innovative and existing REDD finance mechanisms to channel funds to assist tenure and governance reforms in support of community conservation and community-based forest management. This approach has the potential to yield multiple biodiversity, benefit-sharing, climate and other co-benefits.

Financial support for legal and policy change can be cost effective and would help tackle some of the direct and indirect drivers that are causing the loss of forest biodiversity in tropical countries (e.g. unjust tenure regimes and perverse incentives). Such targeted CBD finance may also help achieve synergies with other international agreements, including those relating to climate change, human rights and sustainable development.
The adoption of REDD+ safeguards under the UNFCCC likewise offers opportunities to formulate operational standards that aim to uphold obligations and commitments of Parties under the CBD. In this context, ongoing CBD regional consultations on “REDD-plus Biodiversity Safeguards” in 2011-12 could develop proposals for effective adherence to CBD standards, including articles 8j, 10c and 10d and relevant elements of CBD work programmes.

These CBD consultations on safeguards should discuss the application of important CBD principles and tools to innovative finance, including the CBD’s ecosystem approach and the Akwé:Kon voluntary guidelines for the conduct of cultural, environmental and social impact assessments regarding developments proposed to take place on, or which are likely to impact on, sacred sites and on lands and waters traditionally occupied or used by indigenous and local communities.35

Conclusions

1. There is very little solid evidence to show that innovative finance mechanisms such as biodiversity offsets and forest bonds would contribute to the achievement of one or more of the three objectives of the convention. Available evidence on biodiversity offsets suggests that they might run counter to the objectives of the CBD.

2. Some innovative finance mechanisms remain at the theoretical or conceptual stage or are in their infancy in testing in the field: it is thus difficult to fully assess their potential impacts and effectiveness in supporting CBD objectives. It is therefore of vital importance to gather further details and compile independent case studies on these finance initiatives (if and when they are developed).

3. Targeted finance for participatory and rights-based PES schemes that uphold FPIC and recognise, secure and reward indigenous customary sustainable use systems have potential to advance progress towards the 2020 Aichi Biodiversity Targets, such as Target 18 on traditional knowledge.36

4. Robust safeguards, fulfilment of international obligations, effective monitoring and public accountability arrangements are needed at the national and international levels to reduce risks associated with REDD+ finance.

5. Targeted REDD+ readiness finance in support of governance, legal and tenure reforms (including measures to recognise and respect the rights and governance systems of indigenous peoples in line with Article 10c) would help ensure that REDD+ actions and investments meet the objectives of the convention and enable countries to meet their international obligations under the CBD and other environmental and human rights treaties.
6. Existing international support for safeguards and accountability measures in REDD+ finance offer an unprecedented opportunity for the Parties of the CBD to consolidate international norms and principles in support the objectives of the Convention.

7. Innovative finance mechanisms including carbon trading and proposals for new markets in environmental services or ‘utilities’ are highly controversial and need to be subjected to thorough public scrutiny to examine the pros and cons, advantages and disadvantages of these finance tools.

8. The nomenclature and definition of “innovative financial mechanisms” remains unclear within the CBD process. Both need to be refined to assist Parties in further work on this issue at both the international and national levels.

**Recommendations**

- Given the unproven sustainability of different innovative finance mechanisms, Parties should apply a precautionary approach and avoid decisions and commitments on this topic until reliable evidence is available to demonstrate the usefulness of different funding mechanisms in helping to achieve the objectives of the Convention.

- To assist further work of the Convention on this important topic, COP11 should consider inviting submission of up-to-date and detailed case studies on the impact and effectiveness of innovative finance initiatives.

- Measures need to be put in place by Parties and by finance agencies to ensure that all “innovative financial mechanisms” for conservation and sustainable use fully uphold CBD standards and other relevant international norms, including human rights standards.

- Ongoing CBD consultations on REDD+ biodiversity safeguards in 2011-12 should enumerate the relevant CBD and other applicable international standards to be adhered to by global, regional, national and other finance mechanisms in order to further the objectives of the Convention and enable countries to fulfil their commitments under the CBD.

- At a minimum, standards relating to indigenous peoples should be consistent with the UN Declaration on the Rights of Indigenous Peoples, including requirements for free, prior and informed consent for all finance decisions and investments that may affect indigenous peoples’ lands, territories and natural resources.

- CBD development of biodiversity safeguards for REDD+ finance should make direct reference to agreed CBD principles and approaches such as the Ecosystem Approach as well as existing innovative CBD tools such as the Akwekon guidelines on environmental, social and cultural impact assessment.
• Work by governments and major groups within the UNFCCC to establish a system of information for REDD+ safeguards should include information on compliance with CBD standards relating to indigenous peoples and local communities

• GEF safeguard principles on indigenous peoples under development in 2011 must ensure close alignment with CBD objectives, norms, principles and work programmes (including Articles 8j and 10c as well as relevant elements of the work programmes)

• CBD working and expert groups should be tasked with assessing how strategic targeting and sequencing of existing and innovative international financial flows for environmental conservation and sustainable use can help promote effective implementation of CBD objectives and work programmes (including targeted support for indigenous peoples and local communities)

• Upcoming public participatory consultations on the revision and updating of NBSAPs should include open public debate on different finance options for implementation of the CBD at the local and national levels. Such debates should cover a range of innovative options and measures as well as existing tools, including reform of existing taxes and subsidies that may be harmful to biodiversity (such as subsidies to fossil fuels) and the creation of taxes and subsidies that promote the conservation and sustainable use of biological resources.
